SMART SHOPPING. STRONGER BUSINESS.

SHOP PERFORMANCE

Sales, customer and operational analytics

From raw transaction data to decision-ready insight

EXECUTIVE SUMMARY

BUSINESS CONTEXT

Shop Performance Analytics was undertaken to understand how an online electronics retailer is performing across revenue, orders, products, customers and payment activity. The analysis uses transaction-level order data combined with customer, product and payment information to connect revenue, order volume, pricing, discounts, customer segments and purchasing behaviour. The objective is to move beyond reporting sales activity and identify the commercial and operational factors influencing performance.

BUSINESS OBJECTIVES

- **Revenue & Growth** — Understand how much revenue the shop generates, how many orders it processes, the average order value, and how revenue changes month by month.
- **Product & Category Performance** — Identify the products and categories generating the most revenue and selling the highest number of units, and determine whether revenue leaders are also volume leaders.
- **Customer Value** — Assess which cities and customer segments — **New, Regular and VIP** — contribute most to the shop's revenue and purchasing activity.
- **Operational & Payment Performance** — Evaluate cancelled and returned orders, payment failures and payment-method performance to identify potential operational friction.
- **Discount Effectiveness** — Assess whether higher discounts are associated with larger orders or whether they primarily reduce realised revenue.

KEY BUSINESS INSIGHT

The opportunity is not simply to increase sales, but to understand what is driving revenue, order value, product demand and customer value, while identifying operational and commercial areas that may require attention. By connecting revenue growth, product mix, customer segments, geographic performance, payment outcomes and discount behaviour, the analysis provides a decision-ready view of where the shop is performing strongly and where further investigation or targeted action may be warranted.

REVENUE

R2.98M

Completed + Paid

ORDERS

42 849

Completed + Paid

AVERAGE ORDER VALUE

R69.50

Revenue ÷ orders

UNITS SOLD

80 482

Completed + Paid

01 | REVENUE BASE

2024 and 2025 full-year revenue were essentially flat (-0.4%). The main story is stability rather than sustained growth.

02 | COMMERCIAL CONCENTRATION

Electronics generated 50.6% of revenue. Headphones led product revenue at R291.3K, while Notebook led unit volume at 8,876 units.

03 | PROMOTION ECONOMICS

Average quantity stayed around 1.87–1.90 units as discounts increased. Higher discount levels were associated with lower total revenue.

Decision focus: protect the revenue base, improve basket economics, and use targeted interventions rather than broad discounting.

THE ANALYTICAL FRAMEWORK - MIRO Application

Decision focus: protect the revenue base, improve basket economics, and use targeted interventions rather than broad discounting.

THE SCOPE OF WORK

01

BUSINESS ASK

How is the shop performing?

02

DATA PREP

Clean, standardise and validate

03

JOIN

Orders + Products + Customers +
Payments

04

ANALYSE

Revenue, customers, products,
payments

05

INSIGHT

Identify patterns and business
meaning

06

ACTION

Three practical recommendations

DATA SCOPE

4 Data tables: customers, orders, products and payments
10,000 customers • 50,000 unique orders • 20 products
Analysis period: January 2024 to June 2026

ANALYTICAL OUTPUTS

Revenue & average order value • monthly trend • product/category performance
City & customer segment value • cancellations/returns • payment failures
Discount behaviour and business recommendations

REVENUE PERFORMANCE & SEASONALITY

FULL-YEAR COMPARISON

2024: R1.26M
2025: R1.25M (-0.4%)

SEASONAL PEAK

November and July had the highest average monthly revenue: about R108.9K and R108.9K.

LOWER MONTH

February had the lowest average monthly revenue at about R85.4K.

So what? Revenue is broadly stable across the two complete years, with recurring calendar peaks suggesting an opportunity to plan inventory and commercial activity around seasonal demand.

PRODUCT & CATEGORY PERFORMANCE

Top products by revenue

Revenue by category

REVENUE LEADER

Headphones generated R291.3K, the highest product revenue.

VOLUME LEADER

Notebook sold 8,876 units, showing that the volume leader is not the revenue leader.

CATEGORY CONCENTRATION

Electronics generated 50.6% of total revenue, making mix management a major commercial lever.

CUSTOMER & GEOGRAPHIC VALUE

Revenue by city

Tehran is the largest revenue market at R820K (27.5% of revenue).

Revenue by customer segment

CUSTOMER SEGMENT

Regular customers generated R1.65M, or 55.5% of revenue. New customers contributed 34.8%; VIP customers 9.7%.

So what? Retention and basket-building among the Regular segment should be managed alongside the largest city markets.

ORDER, PAYMENT & DISCOUNT SIGNALS

COMPLETED

91.99%

of order records

CANCELLED

4.94%

of order records

RETURNED

3.06%

of order records

PAYMENT FAILED

3.85%

all payment attempts

REFUNDED

3.01%

all payment attempts

Payment failure rate by method

Payment-method failure rates are tightly clustered (3.64%–3.89%), so there is no large method-level gap in this dataset.

Discount impact | revenue falls while average quantity stays flat

Discounts do not materially lift average quantity (1.87–1.90 units), while total revenue declines at higher discount levels.

KEY FINDINGS & RECOMMENDATIONS

REVENUE & DEMAND PATTERN

- Revenue performance varies across the trading period.
- November is the identified peak month, while weaker periods show a clear opportunity to stimulate demand.
- The monthly pattern should be used to distinguish peak, stable and softer trading periods rather than treating demand as uniform.

RECOMMENDATION

- Peak periods: protect stock availability and operational capacity.
- Softer periods: test targeted promotions and bundles to stimulate demand.
- Use the observed monthly pattern to plan inventory, promotional activity and operational capacity.

PRODUCT & CUSTOMER VALUE

- Headphones are the highest-revenue product at 292,151.25, while Power Bank leads unit volume at 4,805 units.
- Office Chair also contributes significant revenue (288,261) and Tablet generates 243,789.
- This shows that high-volume products are not necessarily the highest-value products.
- Customer value should therefore be assessed across New, Regular and VIP segments, including which products are being purchased within each segment.

RECOMMENDATION

- Protect: Headphones, Office Chair and Tablet as high-value contributors.
- Build volume: use Power Bank and other high-unit products as opportunities for cross-sell and basket building.
- Analyse product combinations by New / Regular / VIP to identify opportunities for higher basket value and repeat purchasing.

ORDER & PAYMENT PERFORMANCE

- Revenue is also affected by the quality of the order-to-payment process.
- Cancelled/returned orders and failed payments represent potential revenue leakage.
- Payment performance should be assessed by payment method to identify where failures are concentrated.

RECOMMENDATION

- Monitor cancellation, return and payment-failure rates by month and payment method.
- Investigate recurring failure points and reduce avoidable lost orders.
- Track these measures alongside revenue so operational improvements can be linked back to commercial performance.

DATA QUALITY & ANALYTICAL NOTE

- Duplicate records, missing values, inconsistent text and broken relationships were checked during data preparation.
- Revenue calculations were based on the defined treatment of cancelled, returned and unpaid orders.
- Every headline finding in the presentation should remain traceable to the cleaned working dataset.

Decision principle:

Understand → Identify → Act → Measure → Optimise

RECOMMENDATIONS & DATA QUALITY

01 | PROTECT THE CORE

Protect Electronics and the highest-value products while using cross-sell and bundles to increase basket size without relying on broad discounts.

02 | PLAN AROUND DEMAND

Use November/July peaks and February's lower average to plan stock, campaigns and operational capacity around the observed calendar pattern.

03 | TARGET VALUE

Prioritise retention and basket-building among Regular customers and the largest markets, while testing targeted offers rather than blanket 20–30% discounts.

DATA QUALITY & CLEANING DECISIONS

120 duplicate order rows/IDs removed → 50,000 unique orders

Customer cities standardised: tehran → Tehran; Mashad → Mashhad

180 missing ages addressed using the median in the cleaned customer table

35 missing payment dates retained as a data-quality limitation

IMPORTANT ANALYTICAL NOTE

Revenue analysis is restricted to Completed + Paid orders.

18 negative-quantity records remain in the analytical set and reduce reported revenue by R920.30; they should be reviewed in the source data.

Every headline number in this deck is traceable to the cleaned working data.

Decision principle: Understand → Identify → Act → Measure → Optimise
